

# Wireframe model & Short description of the layout

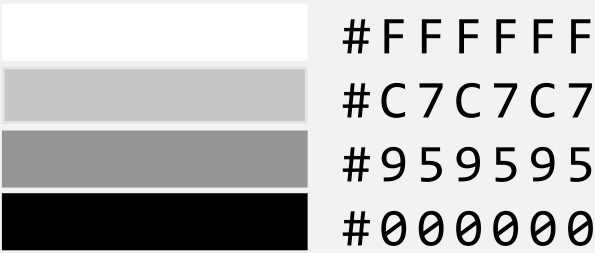

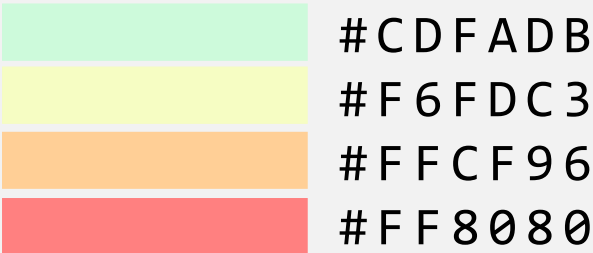

- Explanation about the website at the left. Big Menus at right for the first page for easy navigation.
- Smaller menus on the rest of the page for more focus on page content.

- Categorize the content into two to simply organize it.
- Table to arrange lots of contents with pictures.
- Row of videos and descriptions as match.
- Buttons of content for copy.

## Evaluation

- Changed the table as a title of part and instruction part. Since there were lots of contents made it as a button so the ingredient side and recipe side can be swapped to appear when clicked.
- Deleted description of the videos to make the videos easier to see and added the subtitle for the page.
- Needed to use script for copy, therefore didn't implement a button function and just designed the content as div.

## Outline of how I tested

- Checked if each page has a proper title.
- Checked if the links to all the 5 pages worked.
- Checked if the picture appeared well and if not had the proper description of the picture.
- Checked if the layout didn't have words overlapped.
- Checked if the button worked for hover and clicked for the recipe page.
- Checked if the video loaded properly and played well with the sound on.
